## Diagram Summary:

Not Started	6
Not Applicable	0
Needs Investigation	0
Mitigation Implemented	0
Total	6
Total Migrated	0

## Interaction: IoT Temperature Data Request

1. An adversary may execute unknown code on IoT Device [State: Not Started] [Priority: High]

**Category:** Tampering

**Description:** An adversary may launch malicious code into IoT Device and execute it

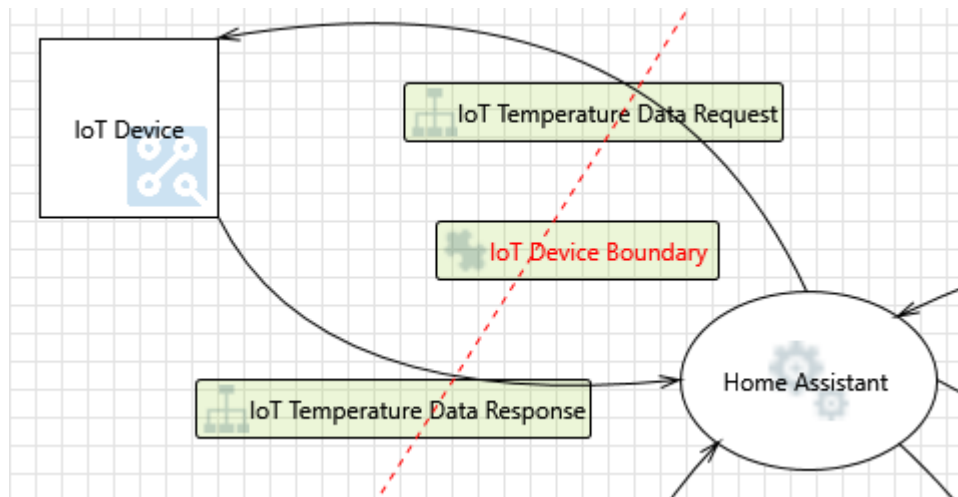

**Justification:** <no mitigation provided>

**Possible** Ensure that unknown code cannot execute on devices. Refer: <a

**Mitigation(s):** href="https://aka.ms/tmtconfigmgmt#unknown-exe">https://aka.ms/tmtconfigmgmt#unknown-exe</a>

**SDL Phase:** Design

## Interaction: IoT Temperature Data Response

2. An adversary may tamper the OS of a device and launch offline attacks [State: Not Started] [Priority: High]

**Category:** Tampering

**Description:** An adversary may launch offline attacks made by disabling or circumventing the installed operating system, or made by physically separating the storage media from the device in order to attack the data separately.

**Justification:** <no mitigation provided>

**Possible Mitigation(s):** Encrypt OS and additional partitions of IoT Device with Bitlocker. Refer: <a href="https://aka.ms/tmtconfigmgmt#partition-iot">https://aka.ms/tmtconfigmgmt#partition-iot</a>

**SDL Phase:** Design

3. An adversary may tamper IoT Device and extract cryptographic key material from it [State: Not Started] [Priority: High]

**Category:** Tampering

**Description:** An adversary may partially or wholly replace the software running on Home Assistant, potentially allowing the replaced software to leverage the genuine identity of the device if the key material or the cryptographic facilities holding key materials were available to the illicit program. For example an attacker may leverage extracted key material to intercept and suppress data from the device on the communication path and replace it with false data that is authenticated with the stolen key material.

**Justification:** <no mitigation provided>

**Possible Mitigation(s):** Store Cryptographic Keys securely on IoT Device. Refer: <a href="https://aka.ms/tmtcrypto#keys-iot">https://aka.ms/tmtcrypto#keys-iot</a>

**SDL Phase:** Design

4. An adversary may exploit known vulnerabilities in unpatched devices [State: Not Started] [Priority: High]

**Category:** Tampering  
**Description:** An adversary may leverage known vulnerabilities and exploit a device if the firmware of the device is not updated  
**Justification:** <no mitigation provided>  
**Possible Mitigation(s):** Ensure that the Cloud Gateway implements a process to keep the connected devices firmware up to date. Refer: <a href="https://aka.ms/tmtconfigmgmt#cloud-firmware">https://aka.ms/tmtconfigmgmt#cloud-firmware</a>  
**SDL Phase:** Design

5. An adversary may exploit unused services or features in Home Assistant [State: Not Started] [Priority: High]

**Category:** Elevation of Privileges  
**Description:** An adversary may use unused features or services on Home Assistant such as UI, USB port etc. Unused features increase the attack surface and serve as additional entry points for the adversary  
**Justification:** <no mitigation provided>  
**Possible Mitigation(s):** Ensure that only the minimum services/features are enabled on devices. Refer: <a href="https://aka.ms/tmtconfigmgmt#min-enable">https://aka.ms/tmtconfigmgmt#min-enable</a>  
**SDL Phase:** Implementation

6. An adversary may gain unauthorized access to privileged features on IoT Device [State: Not Started] [Priority: High]

**Category:** Elevation of Privileges  
**Description:** An adversary may get access to admin interface or privileged services like WiFi, SSH, File shares, FTP etc., on a device  
**Justification:** <no mitigation provided>  
**Possible Mitigation(s):** Ensure that all admin interfaces are secured with strong credentials. Refer: <a href="https://aka.ms/tmtconfigmgmt#admin-strong">https://aka.ms/tmtconfigmgmt#admin-strong</a>  
**SDL Phase:** Implementation
